

# Propositional Dynamic Logic

## Actions

Can be seen as transitions between states

On a set of states  $S = \{s_1, s_2, s_3, s_4\}$ , actions are binary relations on  $S$ :

$$R_a := \{(s_1, s_1), (s_1, s_2), (s_2, s_2)\}$$

## Identity Relation

$$I := \{(s, s) \mid s \in S\}$$

## Composition

$$R_a \circ R_b := \{(s, s') \mid \text{there is } s'' \in S \text{ such that } R_a ss'' \text{ and } R_b s''s'\}$$

$$R_a := \{(s_1, s_1), (s_1, s_2), (s_2, s_2)\}$$

$$R_b := \{(s_1, s_4), (s_2, s_3), (s_4, s_3)\}$$

$$R_a \circ R_b = \{(s_1, s_4), (s_1, s_3), (s_2, s_3)\}$$

In particular:

$$R_a^0 := I; \quad R_a^1 := R_a \circ R_a^0;$$

$$R_a^2 := R_a \circ R_a^1; \quad R_a^3 := R_a \circ R_a^2$$

## Union Relation

$$R_a \cup R_b := \{(s, s') \mid R_a ss' \text{ or } R_b ss'\}$$

$$R_a := \{(s_1, s_1), (s_1, s_2), (s_2, s_2)\}$$

$$R_b := \{(s_1, s_4), (s_2, s_3), (s_4, s_3)\}$$

$$R_a \cup R_b = \{(s_1, s_1), (s_1, s_2), (s_2, s_2), (s_1, s_4), (s_2, s_3), (s_4, s_3)\}$$

## Repetition, zero or more times

$$R_a^* := \{(s, s') \mid R_a^n ss' \text{ for some } n \in \mathbb{N}\}$$

$$R_b := \{(s_1, s_4), (s_2, s_3), (s_4, s_3)\}$$

$$R_b^0 = \{(s_1, s_1), (s_2, s_2), (s_3, s_3), (s_4, s_4)\}$$

$$R_b^1 = \{(s_1, s_4), (s_2, s_3), (s_4, s_3)\}$$

$$R_b^2 = \{(s_1, s_4), (s_2, s_3), (s_4, s_3), (s_1, s_3)\}$$

$$R_b^3 = \{(s_1, s_4), (s_2, s_3), (s_4, s_3), (s_1, s_3)\}$$

⋮

$$R_b^* = \{(s_1, s_1), (s_2, s_2), (s_3, s_3), (s_4, s_4), (s_1, s_4), (s_2, s_3), (s_4, s_3), (s_1, s_3)\}$$

## Converse action

$$R_a^- := \{(s', s) \mid R_a ss'\}$$

$$R_b := \{(s_1, s_4), (s_2, s_3), (s_4, s_3)\}$$

$$\check{R}_b = \{(s_4, s_1), (s_3, s_2), (s_3, s_4)\}$$

## Language of PDL

### • Formulas →

- (1) every basic proposition
- (2) formulas with logical connectives
- (3)  $\langle \alpha \rangle \varphi$ , where  $\alpha$  is action and  $\varphi$  formula

### • Actions →

- (1) every basic action
- (2)  $\alpha; \beta$ ,  $\alpha \cup \beta$ ,  $\alpha^*$
- (3)  $?\varphi$ , where  $\varphi$  is a formula

# Intutions and abbreviations

---

$\alpha; \beta$  **sequential composition**: execute  $\alpha$  and then  $\beta$ .

$\alpha \cup \beta$  **non-deterministic choice**: execute  $\alpha$  or  $\beta$ .

$\alpha^*$  **repetition**: execute  $\alpha$  zero, one, or any *finite* number of times.

$?\varphi$  **test**: check whether  $\varphi$  is true or not.

---

$\langle \alpha \rangle \varphi$   $\alpha$  can be executed in such a way that, after doing it,  $\varphi$  is the case.

---

We abbreviate  $p \vee \neg p$  as  $\top$ .

We abbreviate  $\neg \top$  as  $\perp$ .

We abbreviate  $\neg \langle \alpha \rangle \neg \varphi$  as  $[\alpha] \varphi$ .

---

$[\alpha] \varphi$  After any execution of  $\alpha$ ,  $\varphi$  is the case.

---

---

$\langle \alpha \rangle \top$   $\alpha$  can be executed.

$[\alpha] \perp$   $\alpha$  cannot be executed.

$\langle \alpha \rangle \varphi \wedge \neg [\alpha] \varphi$   $\alpha$  can be executed it at least two different ways.

---

## Models

↳ **Labelled transition systems**

(1)  $S$ , non-empty set of states

(2) **Valuation function**  $\rightarrow$  indicates which atomic propositions are true in each state

(3) **Binary relation**  $R_a$  for each action  $a$

$M = \langle S, R, V \rangle$

**Pointed labelled transition system** = Process graph

↳ has a root state
