

Integration

A. Calc. Chapters 5.2-4, 2.10

Definite Integrals

$f(x)$ is cont. on $[a, b]$

How do we calculate this area?

$a < x_1 < x_2 < x_3 < b \rightarrow$ partition of $[a, b]$

$$\Delta x_n = x_{n+1} - x_n$$

\uparrow
 P

$$U = \sum f(u_k) \cdot \Delta x > A$$

upper boundary of Area below the curve

\uparrow
max

\uparrow
base of each rect

the smaller the partitions are, the closer U will get to A

$$A \geq L(f, P) = \sum_k f(l_k) \cdot \Delta x_k \leftarrow \text{Riemann Sum}$$

\hookrightarrow as $\Delta x \rightarrow 0$, $L(f, P)$ converges to A

\hookrightarrow as $\Delta x \rightarrow 0$, $U(f, P)$ converges to A

Definite integral:

A function is integrable

\uparrow
complete def from slides

Integrable functions

- Piecewise continuous functions are integrable

Notation

$$\int_a^b f(x) dx$$

$b \leftarrow$ upper bound
 $a \leftarrow$ lower bound
 $f(x) \leftarrow$ Integrand
 $dx \leftarrow$ Integration variable

Things to note

- When is an integral negative?

$$\hookrightarrow \int_a^b f(x) dx < 0 \text{ if } f(x) < 0 \text{ and } a < b$$

$$\hookrightarrow \int_b^a f(x) dx < 0 \text{ if } f(x) > 0 \text{ and } a < b$$

Integrating even and odd functions

- Even functions:

- Odd functions

Average of a function

$$\langle f \rangle = \bar{f} = \frac{1}{b-a} \int_a^b f(x) dx$$
