

# Calculus: lecture 4

- L'Hôpital rules for calculating limits
- Extreme values
  - Increasing and decreasing functions
  - Global and local extrema
  - Min-max theorem
- Concavity and inflections
- Sketching functions

## Indeterminate forms

- $\lim_{x \rightarrow 0^+} x \ln(x)$   $[0 \cdot \infty]$

- $\lim_{x \rightarrow \infty} \left(1 + \frac{1}{x}\right)^x$   $[1^\infty]$

- $\lim_{x \rightarrow +\infty} (e^x - e^{(x^2)})$   $[\infty - \infty]$

- $\lim_{x \rightarrow 64} \frac{\sqrt{x} - 8}{\sqrt[3]{x^2} - 16}$   $\left[\frac{0}{0}\right]$  l'Hôpital rules.

- $\lim_{x \rightarrow +\infty} x^{\frac{1}{x}}$   $[\infty^0]$

- $\lim_{x \rightarrow \infty} \frac{\ln(x)}{x}$   $\left[\frac{\infty}{\infty}\right]$

# 1st l'Hôpital rule

For  $f(x)$  and  $g(x)$  differentiable functions on  $(a, b)$ , and  $g'(x) \neq 0$  (can be  $-\infty, +\infty$ )

$$\text{IF } \begin{cases} \lim_{x \rightarrow x_0} f(x) = \lim_{x \rightarrow x_0} g(x) = 0 \text{ for some } x_0 \in [a, b] \\ \lim_{x \rightarrow x_0} \frac{f'(x)}{g'(x)} = L \text{ (can be } \infty, \text{ but exists)} \end{cases} \Rightarrow \text{then } \lim_{x \rightarrow x_0} \frac{f(x)}{g(x)} = L$$

(Also true for left / right limits)

\* this rule applies to indeterminate forms  $\left[\frac{0}{0}\right]$

$$f'(x_0) = \lim_{x \rightarrow x_0} \frac{f(x) - f(x_0)}{x - x_0} \approx \frac{f(x) - f(x_0)}{x - x_0}$$

$$\Rightarrow \frac{f(x)}{g(x)} \approx \frac{\cancel{f(x_0)} + f'(x_0)(x - x_0)}{\cancel{g(x_0)} + g'(x_0)(x - x_0)}$$

$$\bullet \lim_{x \rightarrow 64} \frac{\sqrt[3]{x} - 8}{3\sqrt[3]{x^2} - 16} \stackrel{H}{=} \lim_{x \rightarrow 64} \frac{\frac{1}{2\sqrt[3]{x}}}{\frac{2}{3} x^{-1/3}} = \lim_{x \rightarrow 64} \frac{3}{4} \cdot \frac{\sqrt[3]{x}}{\sqrt{x}} = \frac{3 \cdot 4}{4 \cdot 8}$$

$$\bullet \lim_{x \rightarrow \infty} \frac{\ln(x)}{x} \stackrel{H}{=} \lim_{x \rightarrow \infty} \frac{\frac{1}{x}}{1} = 0$$

$$\bullet \lim_{x \rightarrow 0^+} x \ln(x) = \lim_{x \rightarrow 0^+} \frac{\ln(x)}{\frac{1}{x}}$$

$$\bullet \lim_{x \rightarrow +\infty} \underbrace{x}_{\infty}^{\frac{1}{x}} = \lim_{x \rightarrow +\infty} \underbrace{\ln(x)}_{\infty} \cdot \underbrace{\frac{1}{x}}_{\rightarrow 0} = e^0 = 1$$

$$\lim_{x \rightarrow +\infty} \ln(x) \cdot \frac{1}{x} = 0 \Rightarrow$$

## 2nd l'Hôpital rule

For  $f(x)$  and  $g(x)$  differentiable functions on  $(a, b)$ , and  $g'(x) \neq 0$ .

$\hookrightarrow$  can be  $(-\infty, +\infty)$

$$\text{If } \begin{cases} \lim_{x \rightarrow a^+} f(x) = \lim_{x \rightarrow a^+} g(x) = \pm\infty \\ \lim_{x \rightarrow a^+} \frac{f'(x)}{g'(x)} = L \text{ (can be } \infty, \text{ but exists)} \end{cases}$$

$\Rightarrow$   
then

$$\lim_{x \rightarrow a^+} \frac{f(x)}{g(x)} = L$$

(Also true for  $\lim_{x \rightarrow b^-} \frac{f(x)}{g(x)}$ )

\* this rule applies to indeterminate forms  $\left[\frac{\infty}{\infty}\right]$

# Increasing and decreasing functions

- increasing function:  $x_1 < x_2 \Rightarrow f(x_1) < f(x_2)$

$e^x$ ,  $\ln(x)$ ,  $\sqrt{x}$ ,  $ax+b$  ( $a > 0$ )

- decreasing function:  $x_1 < x_2 \Rightarrow f(x_1) > f(x_2)$

$x^2$ , on  $(-\infty, 0]$ ,  $\frac{1}{x}$ , on  $(0, +\infty)$ , ...

- non-increasing:  $x_1 < x_2 \Rightarrow f(x_1) \geq f(x_2)$  (decreasing or flat)

- For a differentiable function  $f$  on  $(a, b)$

if  $f'(x) > 0$  on  $(a, b)$ , then  $f(x)$  is increasing

## Extreme values

- Absolute minimum/maximum:  $f(x)$  has a maximum at  $x_0$  if for all points in the domain,  $f(x) \leq f(x_0)$ .
- Min-max theorem: a continuous function on a closed, bounded domain  $[a, b]$  reaches an absolute minimum and maximum.

- Local minimum/maximum:  $f$  has a local maximum/minimum <sup>at  $x_0$</sup>  if there is an open interval  $(x_0 - h, x_0 + h)$  on which  $f(x_0)$  is an extremum.

↳ if  $f$  is differentiable at a local extremum  $x_0$ , then  $f'(x_0) = 0$ .

$$f'(x_0) = \lim_{h \rightarrow 0} \frac{f(x_0 + h) - f(x_0)}{h} \rightarrow \text{negative if } f(x_0) \text{ is max}$$

$$f'_+(x_0) \leq 0 \quad f'_-(x_0) \geq 0 \Rightarrow f'(x_0) = 0$$

## Extreme values

we can find extreme values at

- end points
- critical points ( $f'=0$ )
- singular points ( $f'$  DNE)

•  $f$  is continuous on  $(a,b)$  (can be  $\mathbb{R}$ )

$$\text{if } \lim_{x \rightarrow a^+} f(x) = L$$

$$\lim_{x \rightarrow b^-} f(x) = M$$

if  $\exists x \in (a,b)$   $f(x) > L$ ,  $f(x) > M$   
then  $f$  has a maximum on  $(a,b)$

# Concavity and inflections

CONVEX  
(concave up)

all chords below  
function

+ tangent lines  
above function

all chords above  
function

+ tangent lines below function

CONCAVE

(concave down)

$$f''(x) > 0$$

$$f''(x) < 0$$

inflection point: if  $f''(x_0)$  exists  
 $f''(x_0) = 0$

## Sketching functions

- domain
- even / odd
- asymptotes
- $f'(x) \rightarrow$  increasing / decreasing intervals
- $f''(x) \rightarrow$  concave / convex

$$f(x) = \frac{1}{\sqrt{x^2 - 1}}$$

- domain?  $x^2 - 1 > 0 \Leftrightarrow (x+1)(x-1) > 0$   
 $\Rightarrow x > 1 \vee x < -1$

- $f(x) \stackrel{?}{=} f(-x) \rightarrow$  yes! the function is even.

- asymptotes

$$\lim_{x \rightarrow \infty} f(x) = \lim_{x \rightarrow \infty} \frac{1}{\sqrt{x^2 - 1}} = 0 \quad \text{HA } y = 0$$

$$\lim_{x \rightarrow 1^+} f(x) = \lim_{x \rightarrow 1^+} \frac{1}{\sqrt{x^2-1}} = +\infty$$

$$\bullet f'(x) = \frac{-1}{x^2-1} \cdot \frac{1}{\cancel{\sqrt{x^2-1}}} \cdot (\cancel{2x}) = \frac{-x}{(x^2-1)^{3/2}}$$

$$f(x) = \frac{1}{\sqrt{x^2-1}} \quad \rightarrow f'(x) \stackrel{?}{=} 0 \quad \text{no, } 0 \text{ is not in the domain}$$

$$f'(x) > 0 \quad \text{for } x < 0 \quad \text{increasing}$$

$$f'(x) < 0 \quad \text{for } x > 0 \quad \text{decreasing}$$

$$f''(x) = \frac{(x^2-1)^{3/2}(-1) - (-x) \cdot \frac{3}{2}(x^2-1)^{1/2} \cdot (\cancel{2x})}{(x^2-1)^3}$$

$$= \frac{-(x^2-1) + 3x^2}{(x^2-1)^{5/2}} = \frac{2x^2+1}{(x^2-1)^{5/2}} > 0$$

$\hookrightarrow$  always convex
