

## **Department of Data Science and Knowledge Engineering**

# Logic 2020/2021 Resit Exam Questions

— Do not turn this page before the official start of the exam! —

First Name, Surname:
Student ID:
Program: Bachelor Data Science and Knowledge Engineering
Course code: KEN1530
Examiners: dr. Otti D'Huys, dr. ir. ing. Nico Roos
<b>Date/time:</b> July 1 <sup>st</sup> , 2021, 9:30-11:30h
Format: Closed book exam.

#### Instructions to students:

Allowed aides: Pens.

General instructions:

- The exam consists of 10 questions on 12 pages (excluding the 1 cover page(s)).
- Answer every question on a separate piece of paper. Do not mix the answers on different exam
  questions.
- Number each page of answers you submit in the top left corner.
- Ensure that you properly motivate your answers.
- Do not use red pens, and write in a readable way. Answers that cannot be read easily cannot be graded and may therefore lower your grade.
- You are not allowed to have a communication device within your reach, nor to wear or use a watch.
- If you think a question is ambiguous, or even erroneous, explain this in detail in your answer.
- If you have not registered for the exam, your answers will not be graded, and thus handled as invalid.

### For on-site exams:

- Fill in your name and student ID number on every page of answers you submit.
- Please make sure that communication devises and watches are not within reach.
- The use of pencils is not allowed.

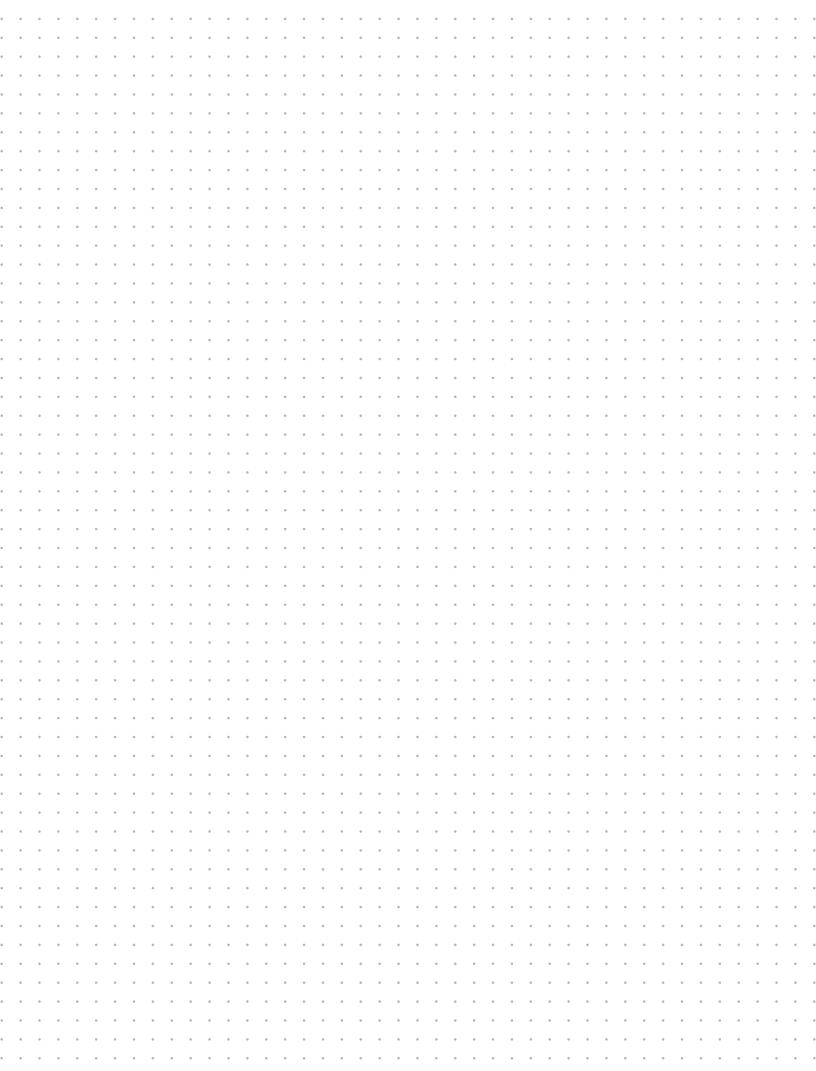

#### For online proctored exams:

- $\bullet\,$  The scan / photographs of your submitted answers must be readable.
- Reserve space for your ID in the top right corner of every page of answers you submit.

#### Success!

### The following table will be filled by the examiner:

Question:	1	2	3	4	5	6	7	8	9	10	Total
Points:	10	10	15	10	10	10	10	5	10	10	100
Score:											

#### (10 points) Question 1

• Alice likes running or Bob likes cycling.

• If Chris likes dancing, then Bob does not like cycling.

B

• It is not the case that (Alice likes running and Chris likes dancing). ( b/ 7a) -> c • If Bob likes cycling and Alice does not like running, then Chris likes dancing.

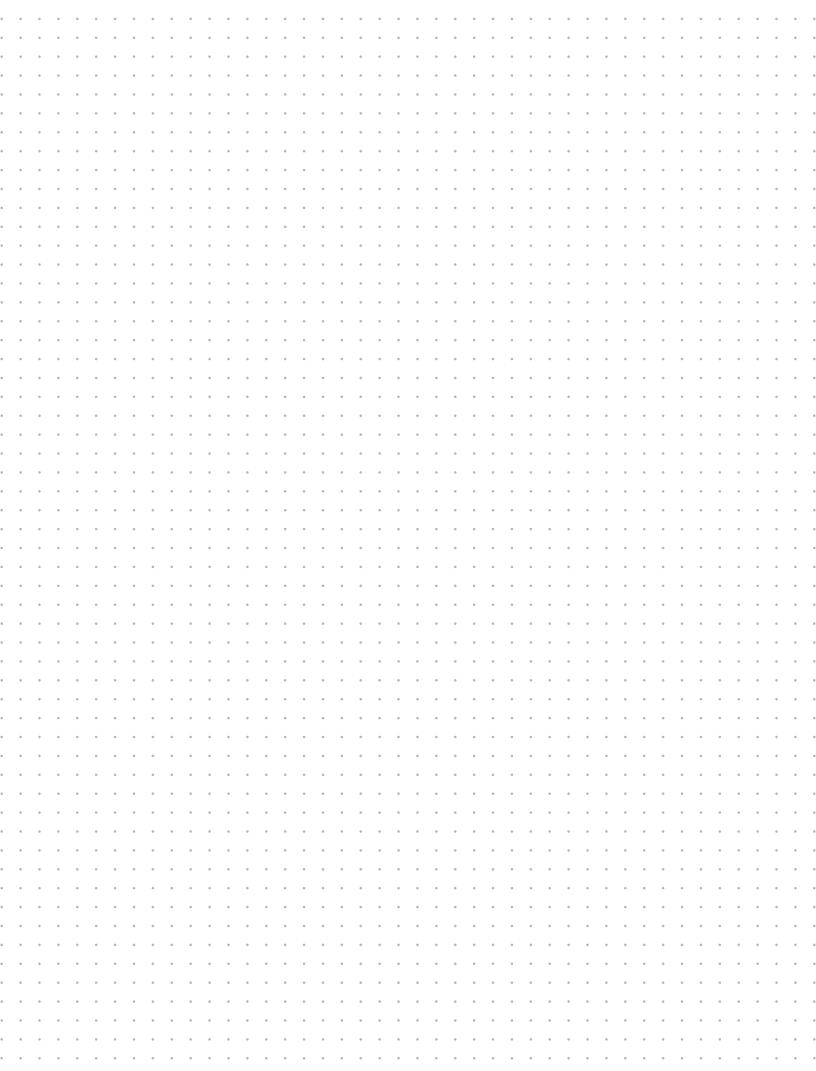

Determine the answers of the following questions using a truth table. (Draw the full table!) Answer with: Yes, No or Unknown!

- Does Alice like running?
- Does Bob like cycling?
- Does Chris like dancing?

Use the atomic propositions a, b and c, use the truth-value 0 representing false and the truth-value 1 representing true, and enumerate the valuations of a, b and c as binary numbers from 0 to 7.

Solution:							
$a b c \parallel a \lor b$	$ c \rightarrow \neg b  \neg$	$(a \wedge c) \mid (b \wedge -$	$a \rightarrow c$				
0 0 0	1 1 1	0 0 1	. 1				
0 0 1 0	1 1 1	0 0 1	. 1				
0 1 0 1	1 0 1	0 1 1					
0 1 1 1	$\bigcirc 0$ 1	0 1 1	. 1				
$\Rightarrow 100$	<u>1</u> 1 1	00					
1 1 1	1 1 0	1 0 0	1				
$\Rightarrow \boxed{1} \boxed{1}$	1 0 1	0 0 0					
1 1 1		1 0 0	1				
• Does Alice like running? yes							
b · Does Bob like cycling? unknown b cam be true or false							
C ◆ Does Chris like dancing? no							

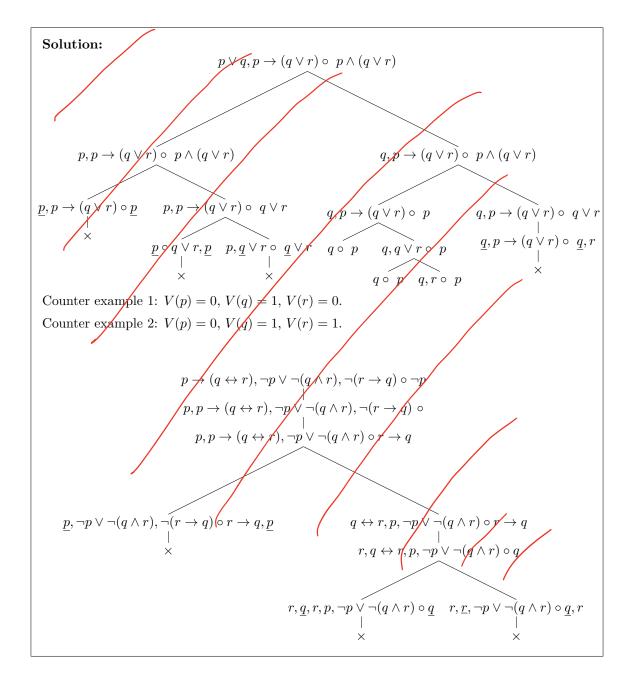

hen are all of a, b and c true?

#### Question 2 (10 points)

Investigate the validity of the following inferences with the aid of a semantic tableau. If an inference is invalid, give **all** the counterexamples.

- $\{p \lor q, p \to (q \lor r), \neg(r \land p) \to \neg q\} \models p \land (q \land r)$
- $\bullet \ \{p \to (q \leftrightarrow r), \neg p \lor \neg (q \land r), \neg (r \to q)\} \models \neg p$

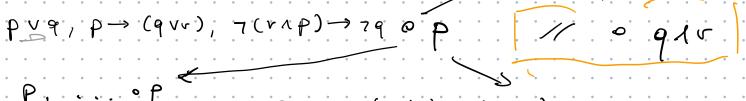

Investigate the validity of the following inferences with the aid of a semantic tableau. If an inference is invalid, give all the counterexamples.

- $\{p \lor q, p \to (q \lor r), \neg(r \land p) \to \neg q\} \models p \land (q \land r)$
- $\{p \to (q \leftrightarrow r), \neg p \lor \neg (q \land r), \neg (r \to q)\} \models \neg p$

(2) 
$$\{p \vee q, p \rightarrow (q \vee v), 7(v \wedge p) \rightarrow 7q \} \neq p \wedge (q \wedge r)$$

$$p \vee q, p \rightarrow (q \vee v), 7(v \wedge p) \rightarrow 7q \circ p \wedge (q \wedge r)$$

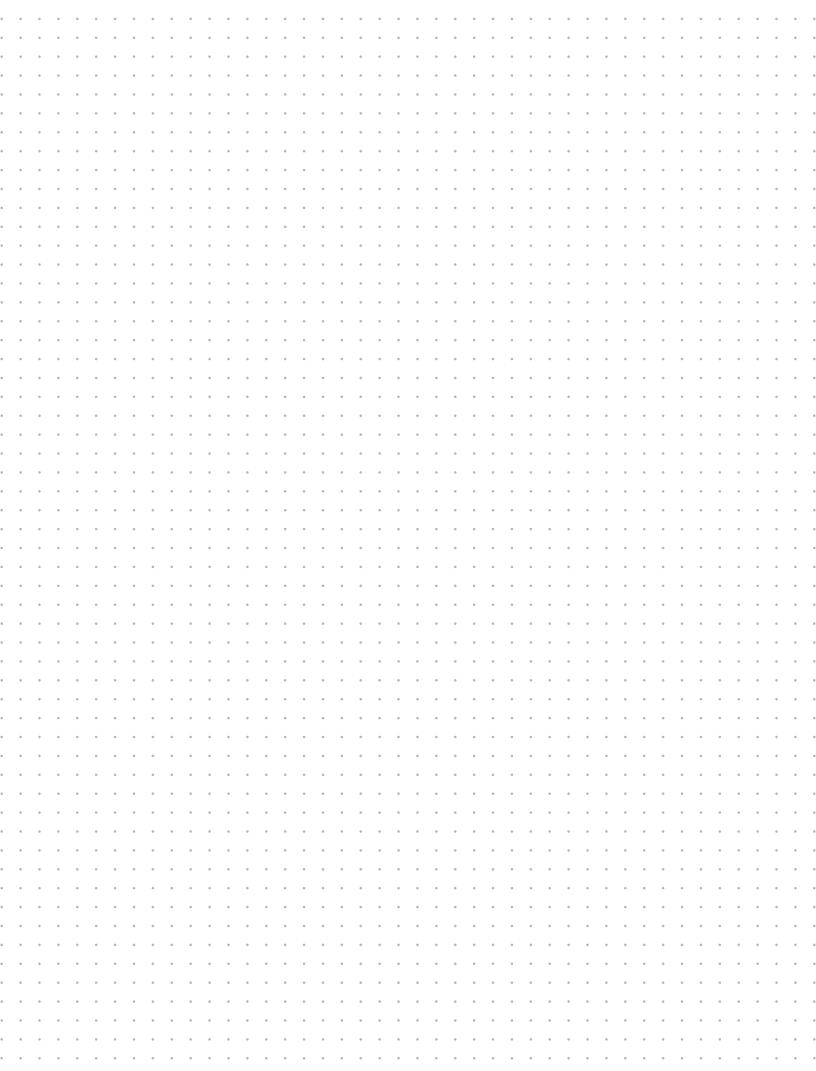

$$+ \rightarrow p u q, p \rightarrow 2(q v r), \neg (r \wedge p) \rightarrow 7q \circ q \wedge r$$

### Question 3 (15 points)

Prove by means of natural deduction:

- From the premises  $p \to \neg(r \to q)$  derive  $p \to (\neg q \land r)$
- From the premise  $\neg(\neg p \lor \neg q)$  derive  $p \land q$

```
Solution:
 2
 3
 4
 5
 6
                                            \wedge I, 5, 6
 7
 8
 9
 10
                                               \perp I, 3, 10
 11
                                              \neg E, 4-11
 12
                                               \rightarrowI, 2, 12
         p \to (\neg q \wedge r)
 13
 1
          \neg(\neg p \lor \neg q)
 2
                                 \forall I, 2
 3
                                  \perp I, 1, 3
 4
 5
                                  \neg E, 2-4
 6
 7
 8
                                  \perp I, 1, 7
 9
                                  \neg E, 6-8
                                  \wedge I, 5, 9
 10
         p \wedge q
```

### Question 4 (10 points)

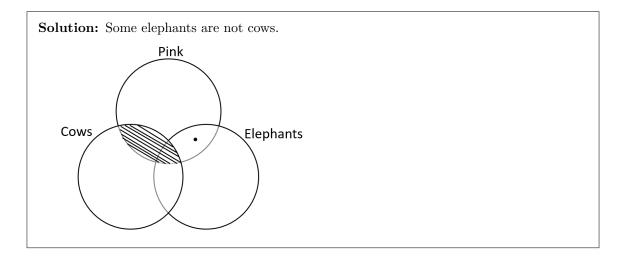

Consider the following two premises of a syllogism:

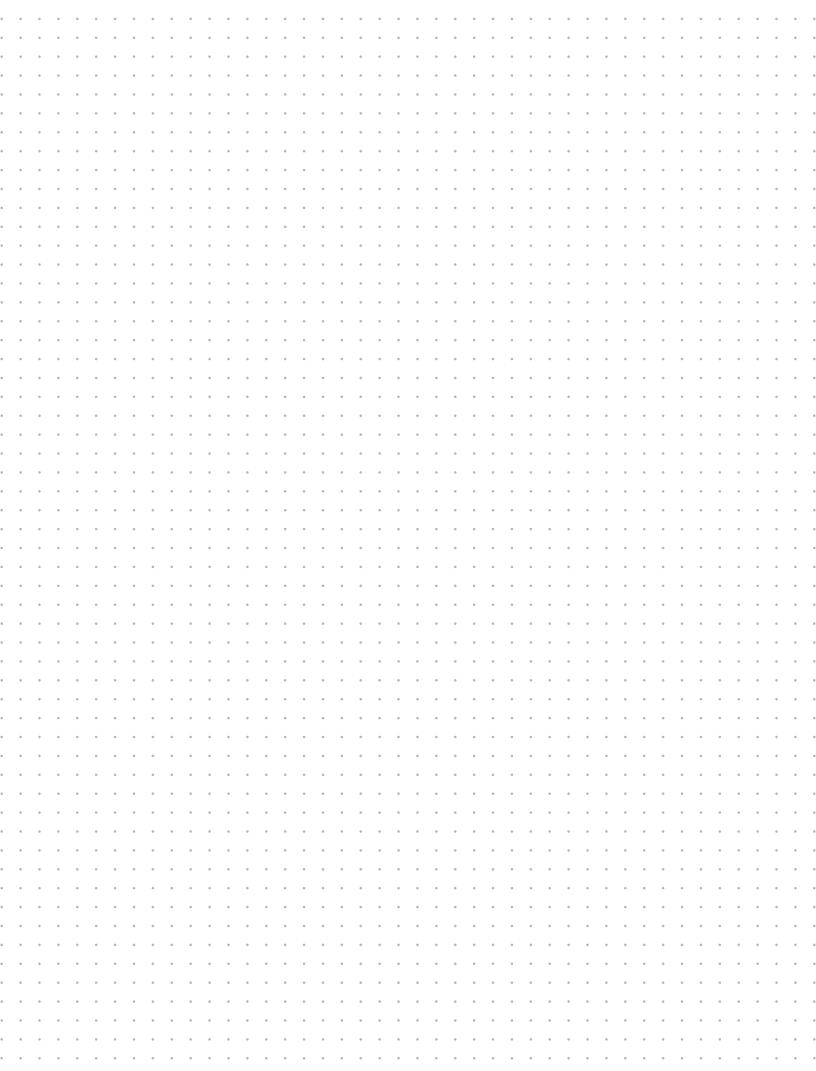

No cow is pink. Some elephants are pink.

27

Complete the syllogism with a conclusion that makes it valid.

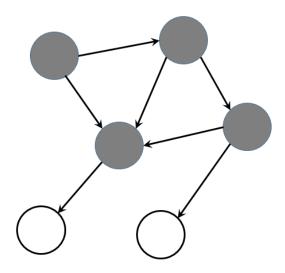

Demonstrate the validity of your syllogism using the method with Venn diagrams.

### Question 5 (10 points)

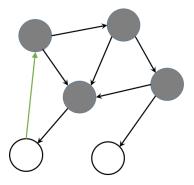

Consider the predicate logic model shown below. The model has a unary predicate P and a binary predicate S. Shaded objects have property P, a  $\rightarrow$  from a to b meant that Sab is true in this model.

- (a) State two closed formulas that are true in this model. Your formulas should include both predicates P and S.
- (b) Add one pair to I(S) (one arrow to the model representation), such that the statement  $\forall x(Px \to \exists ySyx)$  becomes true.

### Solution:

- (a) Examples include  $\forall x(\exists ySxy \to Px), \neg \exists x(Px \land Rxx), \forall x \forall y((Syx \land \neg Px) \to Py), \exists y \exists x(Sxy \land Py \land Px)$
- (b) Any arrow arriving at the upper left object makes the formula true. An example is below

### Question 6 (10 points)

Are the following formulas a tautology? Show by means of a semantic tableau.

- $\forall x \exists y (Ryx \to Rxx)$
- $\forall x ((\exists y R y x) \to R x x)$

Solution:

This statement is a tautology

This tableau has an open branch: we find a countermodel with two objects a and b, with b related to a, but a not related to itself.

### Question 7 (10 points)

Prove by means of natural deduction:

- From the premises  $\{ \forall x (Px \to \exists y Rxy), \forall x (\exists y Ryx \to \neg Px), \exists x Px \}$  derive  $\exists x \neg Px$
- From the premises  $\{ \forall x (Ax \to \neg Bx), \exists x (Bx \land Cx) \}$  derive  $\exists x (Cx \land \neg Ax)$

```
\forall x (Px \to \exists y Rxy)
                    1
                    2
                              \forall x (\exists y Ryx \to \neg Px)
                              \exists x P x
                    3
                              a \mid Pa
                    4
                                    Pa \rightarrow \exists y Ray
                                                                            \forall E, 1
                    5
                    6
                                    \exists y Ray
                                                                            \rightarrowE, 5, 4
Solution: 7
                                    b \mid Rab
                    8
                                           \exists yRyb
                                                                            ∃I, 7
                    9
                                           \exists yRyb \rightarrow \neg Pb
                                                                            \forall E, 2
                    10
                                           \neg Pb
                                                                            \rightarrowE, 9, 8
                                           \exists x \neg Px
                                                                            ∃I, 10
                    11
                                    \exists x \neg Px
                                                                            \exists E, 6, 7-11
                    12
                              \exists x \neg Px
                                                                            \exists E, 3, 4-12
                    13
```

```
Solution:
          \forall x (Ax \to \neg Bx)
 1
 2
          \exists x (Bx \wedge Cx)
 3
          a \mid Ba \wedge Ca
               Ca
 4
                                              \wedge E, 3
                                              \wedge E, 3
 5
               Ba
                     Aa
 6
                     Aa \to \neg Ba
 7
                                              \forall E, 1
 8
                     \neg Ba
                                              \rightarrowE, 6, 7
                                              \perpI, 5, 8
 9
                     \perp
                \neg Aa
                                              \neg I, 6-9
 10
               \neg Aa \wedge Ca
                                              \wedge I, 4, 10
 11
               \exists x (\neg Ax \wedge Cx)
                                              ∃I, 11
 12
 13
          \exists x (\neg Ax \land Cx)
                                              \exists E,\, 2,\, 3\text{--}12
```

Note: the topic of this question (epistemic logic) has been replaced in 2021/2022 by Hoare logic and tableau proofs for PDL. Please ignore this question.

### Question 8 (5 points)

Translate the following sentence into a formula of epistemic logic, using appropriate translation keys.

• Bob does not know whether Chris knows whether Alice likes sailing.

Use the modal operators  $\square_A$ ,  $\square_B$  and  $\square_C$ , and the atomic proposition a.

#### Solution:

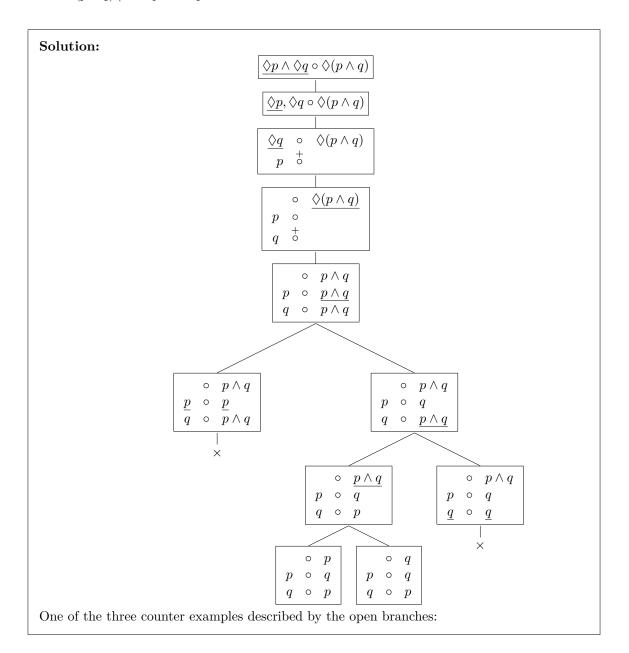

• 
$$\neg(\Box_B(\Box_C a \lor \Box_C \neg a) \lor \Box_B \neg(\Box_C a \lor \Box_C \neg a))$$
  
or  
 $\neg\Box_B(\Box_C a \lor \Box_C \neg a) \land \neg\Box_B \neg(\Box_C a \lor \Box_C \neg a)$ 

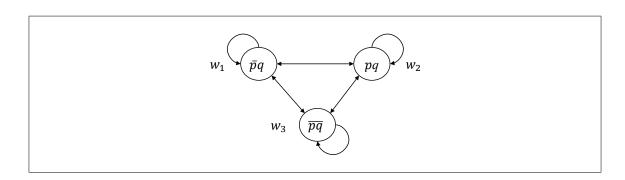

Note: the topic of this question (epistemic logic) has been replaced in 2021/2022 by Hoare logic and tableau proofs for PDL. Please ignore this question.

### Question 9 (10 points)

Investigate the validity of the following inferences with the aid of a semantic tableau. If an inference is invalid, give a counterexample.

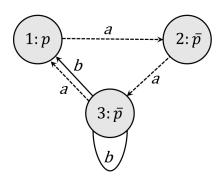

- $\Diamond p \wedge \Diamond q \models \Diamond (p \wedge q)$
- $\neg \Diamond (p \lor q) \models \Box \neg p \land \Box \neg q$

### Question 10 (10 points)

Consider the labelled transition system below, with 3 states and actions a and b.

- (a) In which states are the following formula true?
  - $\langle a^* \rangle p$ .
  - $[b] \neg p$
- (b) Give all the elements of the relation defined by the action  $(?\neg p; a \cup b)^*$ .

#### Solution:

- (a) In which states are the following formula true?
  - $\langle a^* \rangle p$ : true in all states.
  - $[b]\neg p$ : true in states 1 and 2.
- (b) The elements of the relation defined by the action  $(?\neg p; a \cup b)^*$  are (1,1),(2,2),(3,3),(2,3),(3,1),(2,1)
